

# Configure The Application To Receive The Data From Cloud

**TEAM ID:PNT2022TMID39342**

**Node red flow created to get values**

## Configuring function to fetch the desired value

The screenshot displays the Node-RED web interface. On the left, a flow named 'Flow 1' is visible, featuring an 'IBM IoT' node connected to three 'function' nodes, and two '[get] /sensor' nodes connected to 'function' nodes. A 'msg.payload' node is also present. On the right, the 'Edit function node' dialog is open, showing the 'On Message' tab. The function code is as follows:

```
1 msg.payload = msg.payload.temp;  
2 global.set('t',msg.payload)  
3 return msg;
```

The dialog includes a 'Name' field, a 'Properties' section, and buttons for 'Delete', 'Cancel', and 'Done'. The 'Enabled' checkbox is checked.

This screenshot shows the same Node-RED interface as the previous one, but with the function code in the 'On Message' tab updated to fetch humidity data:

```
1 msg.payload = msg.payload.humid;  
2 global.set('h',msg.payload)  
3 return msg;
```

The rest of the interface, including the flow diagram and the 'Edit function node' dialog structure, remains the same.

## App Blocks to render the values and display it in app
